

## **AMENDMENTS TO THE SPECIFICATION**

Please replace the paragraph on page 10, beginning at line 2 with the following:

The wireless communication gateway ~~sever~~ server 2 resides between the information source server 4 connected to the Internet 103 and the wireless data communication network 101 and temporarily stores data from the information source server 4. Then, the server 2 sends the data to the wireless client I so that a buffer memory (not shown) in the wireless client I does not overflow, by monitoring a state of the buffer memory. This is done so as to avoid instability of communication due to decrease of a bandwidth, a delay, or an interrupted wave of the Internet 103 and the wireless data communication network 101. Also, the server 2 includes a font memory 21 which stores a font sent from the font server 5.
